Note:

1. The minimum number of clock cycles is determined by dividing the minimum time required with clock cycle time, and then rounding off to the next higher integer.
2. Minimum delay is required to complete write.
3. All parts allow every cycle column address change.
4. In case of row precharge interrupt, auto precharge and read burst stop.

AC CHARACTERISTICS (AC operating conditions unless otherwise noted)

Refer to the individual component, not the whole module.

Parameter	Symbol	Min	Max	Unit	Note
CLK cycle time	tcc	7.5	1000	ns	ns
CLK to valid output delay	tsac		5.4	ns	1, 2
Output data hold time	toH	3.0		ns	2

Input hold time	tSH	0.8		ns	3
CLK to output in Low-Z	tsLZ	1		ns	2
CLK to output in Hi-Z	tSHZ		5.4	ns	

Note:

1. Parameters depend on programmed CAS latency.
2. If clock rising time is longer than 1ns, $(tr/2-0.5)$ ns should be added to the parameter.
3. Assumed input rise and fall time (tr & tf)= 1ns.
If tr & tf is longer than 1ns, transient time compensation should be considered,
i.e., $[(tr + tf)/2-1]$ ns should be added to the parameter.

(V=Valid, X=Don't Care, H=Logic High, L=Logic Low)

Note:

- OP Code: Operand Code
A0~A11, BA0~BA1: Program keys. (@MRS)
- MRS can be issued only at both banks precharge state.
A new command can be issued after 2 CLK cycles of MRS.
- Auto refresh functions are as same as CBR refresh of DRAM.
The automatically precharge without row precharge command is meant by "Auto".
Auto/self refresh can be issued only at both banks precharge state.
- BA0~BA1: Bank select address.
If both BA0 and BA1 are "Low" at read, write, row active and precharge, bank A is selected.
If both BA0 is "Low" and BA1 is "High" at read, write, row active and precharge, bank B is selected.
If both BA0 is "High" and BA1 is "Low" at read, write, row active and precharge, bank C is selected.
If both BA0 and BA1 are "High" at read, write, row active and precharge, bank D is selected.
If A10/AP is "High" at row precharge, BA0 and BA1 are ignored and both banks are selected.
- During burst read or write with auto precharge, new read/write command cannot be issued.
Another bank read/write command can be issued after the end of burst.
New row active of the associated bank can be issued at tRP after the end of burst.
- Burst stop command is valid at every burst length.
- DQM sampled at positive going edged of a CLK masks the data-in at the very CLK (Write DQM latency is 0), but makes Hi-Z state the data-out of 2 CLK cycles after. (Read DQM latency is 2)
